

Start time: 2:51 pm

### **Going Over the Proposal Draft**

#### **Introduction:**

- We don't have to talk about super basic microbiome stuff
  - If other people in the class know what it is, you don't need to mention it
  - Do not say what the human microbiome is! But stuff about correa cascade is good
- Discussion about IN is more relevant for the manuscript and shouldn't be the main focus yet. For the proposal, you shouldn't give away the results
- Look over the introduction and assess whether the information written is relevant for the analysis being done. The specific methodology of the Wang study is not the most relevant (ex. Random forrest)

#### **Aims:**

- Change the first sentence of each aim as it sounds very redundant. Add the part that's repeating in each aim to the introduction
- Core microbiome should be the second aim, and then move the other aims down

#### **General Notes for Upcoming Manuscript:**

- We can search up for papers that we have found to have significance and discuss them in our discussion section (ex: "LPS + gastric cancer")
- Do metacyc for functional analysis

#### **For next week**

- Finish our own sections, do the edits suggested and read the paper each one fully
- We can make a slide deck for presentation
