

Start: 2:48 PM

- Mention that even in healthy patients, there are sex differences
- Remember that our research is correlation rather than causation!!!!
- No regulation phrasing - ex: upregulation or downregulation → you'd need transcriptome for that analysis but we don't have that data
 - Instead, we can use overrepresentation/underrepresentation phrasing
 - Can also use "more abundant"
 - "H. pylori effect on gastric microbiota 16S"
 - Maybe in vitro or ex vivo microbiome modelling
- Priority for the next few weeks: Plots and Data
- Prioritize the presentation
 - **Maybe start the draft for the script soon? Or the actual oral presentation?**
- Split up the workload more for the alpha and beta diversity
- For presentation, might not necessarily be each person explaining their own analysis but more like a person for intro, another for conclusion and whatever else
- **For next time = show our data and talk about it so we can get more feedback!**
