

Start: 2:48 PM

- For alpha diversity, re-order the plots by stage
- Ensure all plots are similar in style
- For beta-diversity plots, do the analysis for each stage instead of faceting → affecting the statistical analysis
- For core microbiome, do the analysis within each stage as well
- Ensure to include cutoff for differential abundance analysis (methods)
- Search through literature on the genus that are relevant to the IN stage
- For the tuberculosis proteins - make like a general statement connecting it to the disease
- Make the titles in the powerpoint more descriptive
 - Like a figure legend title but shorter instead of a broad title
- Next-next meeting is on stat holiday, should decide if we want to move the day to be earlier or do it on zoom
 - Monday + thursday currently very open but still has lots of availability
