

Start: 2:50 pm

- For beta diversity graphs to demonstrate the p-adjusted values by putting the corresponding p-values on each graph.
- For the graphs on the powerpoint, play with the dimensions so that it is readable by the audience
- For core microbiome, include a legend for color (code on piazza)
- Differential abundance graph, arrange the groups from biggest to smallest based on the value → Rhodococcus should be on top
 - Dplyr function (arrange()) by log2 fold-change and need to change genus to factor)
- Boxplot for the two indicator taxa for male vs. female across stages → code in alpha/beta diversity
- Don't use the plot or table
