

Start Time: 2:49 pm

Note: Parsa is absent!

- Pick 1 age group
- Smaller sample size for young adults (does not have all the stages)
- Should pick middle age → most gastric cancer patients are middle age
- Repeat what Ujemi has done for age → categorization into young adults, middle-aged, and old people
- Middle age → proportion of sample size male vs. female is good

What we should do:

- Choose middle age + old people → ujemi paper said no difference between the two groups maybe we can group them together?
- For aim 2 we would want to do differential abundance analysis in addition + indicator species
- The paper also did differential abundance but we are doing ANCOMBC so its different
- Separate directory for picrust
- Have separate directories for picrust and taxonomic analysis
